

# MVPA of fMRI in Python

ICON 2017 workshop, Lukas Snoek & Steven Miletic,  
University of Amsterdam

## Who are we?

---

- Lukas Snoek
  - **PhD-student** at Steven Scholte's lab (University of Amsterdam)
  - Research on **emotion perception** and **neuroimaging** methods (machine learning/decoding)
  - Enjoy working on **open-source software** projects (mostly related to neuroimaging)
  - **Teaching neuroimaging** (fMRI) courses at the Research Master Psychology

## Who are we?

---

- Steven Miletic
  - Did a great internship on **multimodal decoding** (ensemble learning) at our lab!
  - **Soon-to-be-PhD-student** at Birte Forstmann's lab (University of Amsterdam)
  - Going to do research on **model-based cognitive neuroscience**
  - Currently working together on a project about **(dealing with) confounds in MVPA**

## What's this workshop about?

- **MVPA** of **fMRI** data in **Python**

## What's this workshop about?

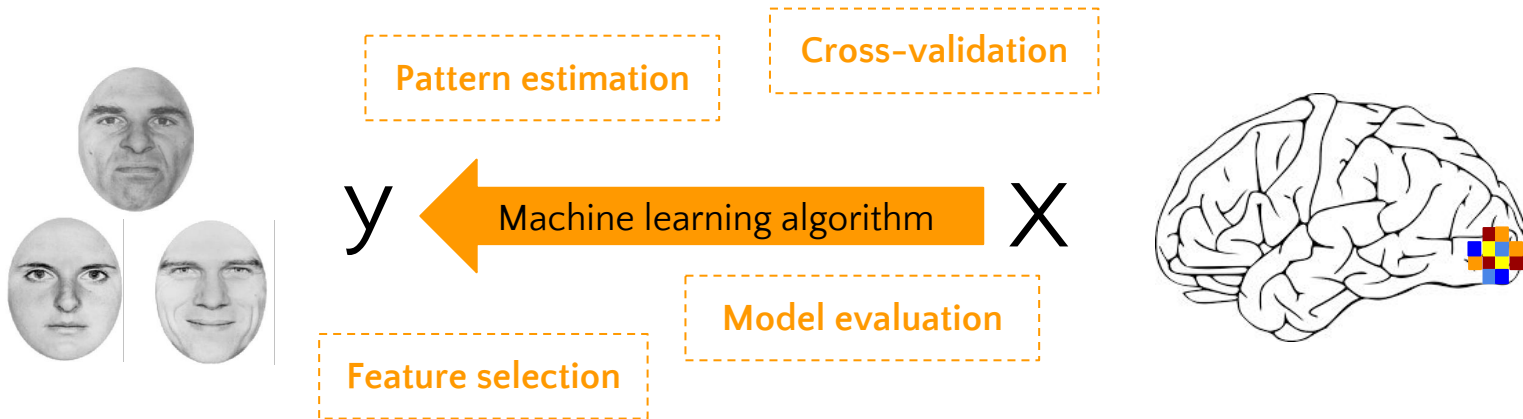

- **MVPA** of **fMRI** data in **Python**
  - any analysis that relates **patterns** of voxels (or sensors in M/EEG) to features in the world (psychological processes, stimuli, traits, or behavior)

## What's this workshop about?

- **MVPA** of **fMRI** data in **Python**
  - Specifically **machine learning** (no time for other pattern analyses like RSA ...)

## What's this workshop about?

- **MVPA** of **fMRI** data in **Python**
  - Specifically **machine learning** (no time for other pattern analyses like RSA ...)
  - Some parts specific to fMRI, but most material is directly applicable to **other modalities** (sMRI, EEG, MEG, etc.)

## What's this workshop about?

- **MVPA** of **fMRI** data in **Python**
  - Specifically **machine learning** (no time for other pattern analyses like RSA ...)
  - Some parts specific to fMRI, but most material is directly applicable to **other modalities** (sMRI, EEG, MEG, etc.)
  - Using Python because of the awesome **scikit-learn** package

## Format of this workshop

- Based on the "Neuroimaging: Pattern Analysis" course
- The tutorial is implemented in a **jupyter notebook**

### This is a Markdown cell!

With some text.

```
In [1]: print('But you can also write code')  
x = 5  
print('x squared = %i' % (x * x))
```

But you can also write code  
x squared = 25

and plot stuff!

```
In [2]: import matplotlib.pyplot as plt  
%matplotlib inline  
plt.title('Awesome inline plotting')  
plt.plot(range(10))  
plt.show()
```

Awesome inline plotting

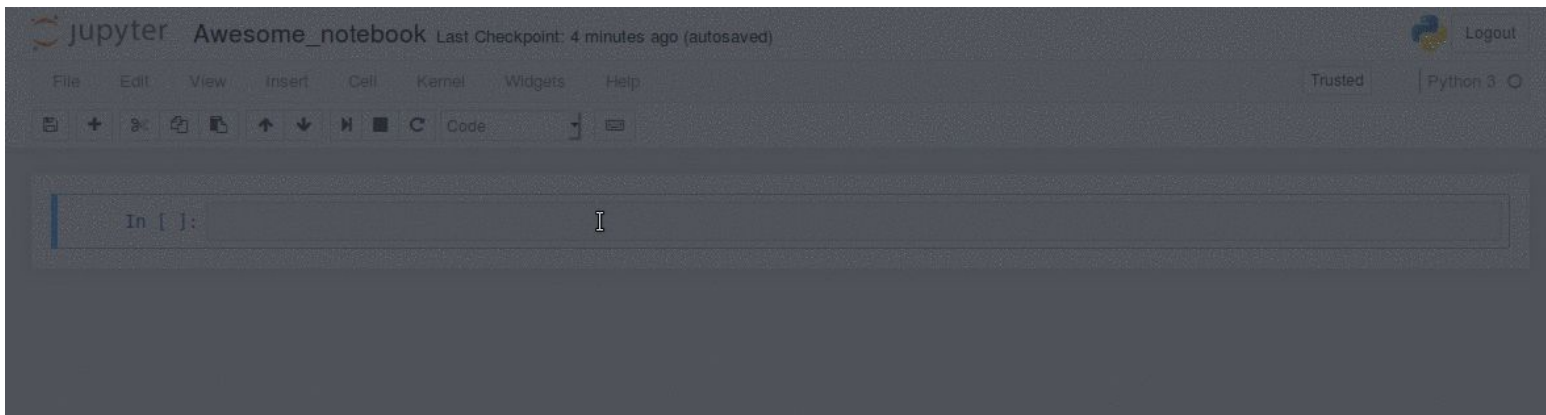

## Jupyter notebooks

---

- Jupyter notebooks provide an **interactive Python environment** in which you can mix code, text, plots, and equations!

# Jupyter notebooks

You can write **Markdown-formatted text** in "text cells" ...  
(Render, or "run", the cell with CTR+ENTER)

# Jupyter notebooks

The screenshot displays the Jupyter Notebook web interface. At the top, the header shows the Jupyter logo, the notebook name 'Awesome\_notebook', and a status message 'Last Checkpoint: 4 minutes ago (unsaved changes)'. On the right, there is a 'Logout' button and a user profile icon. Below the header is a menu bar with options: File, Edit, View, Insert, Cell, Kernel, Widgets, and Help. Underneath the menu bar is a toolbar with various icons for file operations, cell navigation, and execution. The main content area shows a single markdown cell with a blue border. The cell contains the text 'This is a title!' followed by a blue icon, and below it, the text 'And some other text.'.

jupyter Awesome\_notebook Last Checkpoint: 4 minutes ago (unsaved changes) Logout

File Edit View Insert Cell Kernel Widgets Help Trusted Python 3

Markdown

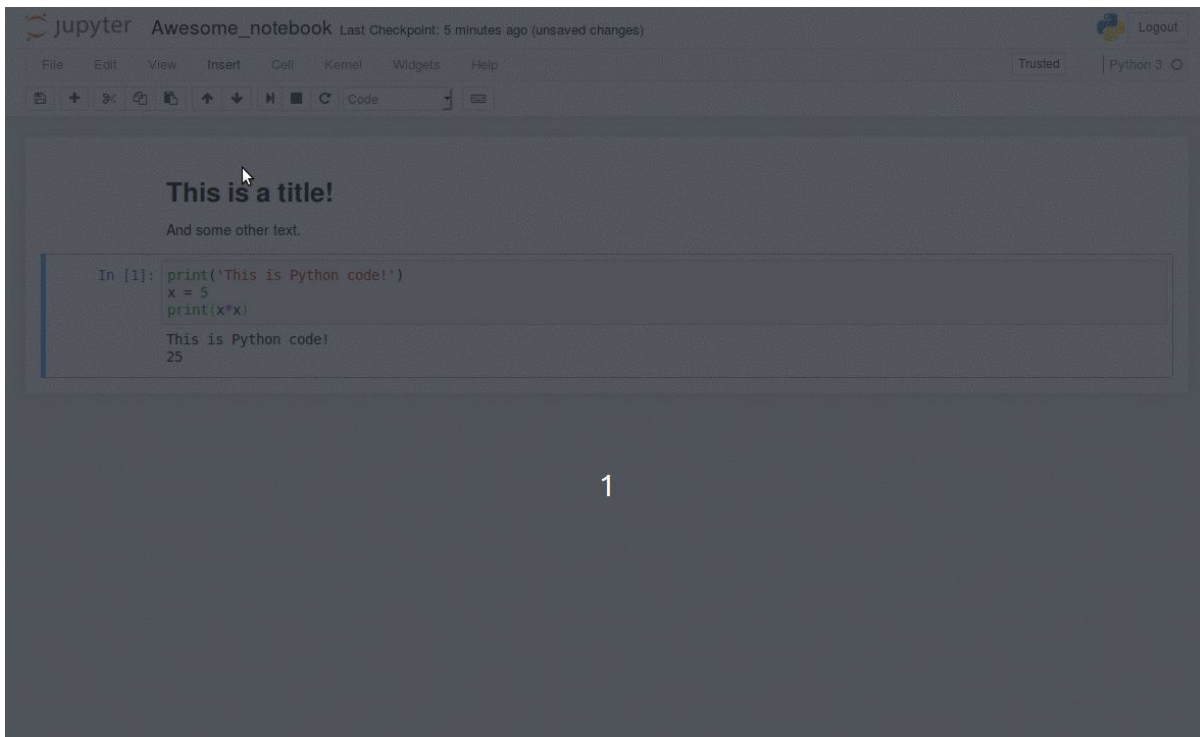

**This is a title!**

And some other text.

And run **regular Python code** in "code cells" ...  
(Run the cell with CTR+ENTER)

# Jupyter notebooks

And create  
inline plots!

# Jupyter notebook

## 1.4.2 tips & tricks to load and transform (nifti-)files

As a first thing, we need to find all the paths to the *t*-stat nifti-files. Python has a nifty (pun intended) tool called "glob" which can find files/directories on disk using [wildcards](#). It is usually imported as follows:

```
In [ ]: from glob import glob
```

glob, in Python, is a function that takes a path (as a string) with one or more wildcard characters (such as the \*) and searches for files/directories on disk that match that. For example, let's try to find all the png-images in the "img" directory using glob (these are the images that I used inside this notebook).

```
In [ ]: import os
# the images are in img/ on Linux/Mac systems, but in img\ on Windows (hence the "os.sep" thingie)
my_search_string = 'img' + os.sep + '*.png'
png_files = glob(my_search_string)
print(png_files)
```

As you can see, it returns a list with all the files/directories that matched the search-string. Note that you can also search files outside of the current directory. To do so, we can simply specify the relative or absolute path to it.

**ToDo:** Now you have the skills to actually "glob" all the *t*-stats from subject **pi0070** yourself! Use glob to find all the paths to the *t*-stats and store the results (a list with 40 strings) in a variable called **tstat\_paths**. Note: the data directory is one directory above the current directory! Hint: watch out! There might be an **ftest.nii.gz** file in the stats-directory ...

```
In [ ]: # Implement your ToDo here
```

## Format of this workshop

- Based on the "Neuroimaging: Pattern Analysis" course
- The tutorial is implemented in a **jupyter notebook**
- The notebook walks you through all steps of MVPA
- With (optional) **programming exercises** and **review questions**
- Ask us (Lukas, Steven, Noor) questions!

### This is a Markdown cell!

With some text.

```
In [1]: print('But you can also write code')  
x = 5  
print('x squared = %i' % (x * x))
```

But you can also write code  
x squared = 25

and plot stuff!

```
In [2]: import matplotlib.pyplot as plt  
%matplotlib inline  
plt.title('Awesome inline plotting')  
plt.plot(range(10))  
plt.show()
```

## Let's start!

[lukas-snoek.com/ICON2017](https://lukas-snoek.com/ICON2017)

`$ python download_data.py`

- Assuming you've downloaded the materials *and* data ...
- ... and you've set up your Python environment ...
- Start the notebook!
  - `$ cd tutorial`
  - `$ jupyter notebook ICON2017_tutorial.ipynb`
- Need an account on our (pre-configured) server? Let us know!

[lukas-snoek.com/ICON2017/configure\\_python.html](https://lukas-snoek.com/ICON2017/configure_python.html)
